

ANTI-ROOT CLOTH

Meuwissen Gerritsen's anti-root cloth is a UV stabilized woven cloth made of polypropylene. The structure of the material is extremely tear-resistant and strong, so weeds have less chance of getting through. In addition, anti-root fabric is suitable for keeping soil layers separated. Despite its strong fine-woven composition, rainwater can pass through the fabric so there is no consequence for plants placed above it.

Application

MG anti-root fabric is applied as a cover for soil to prevent unwanted plant growth. However, rainwater can enter the ground through the fabric, making it suitable under patios or gravel paths, in borders and as a separation layer between two soil types to prevent mixing.

Benefits

- ✓ Easy processing
- ✓ Effective protection against weed growth
- ✓ Convenient packaging
- ✓ Strong open structure
- ✓ Recyclable
